## DETAILED ACTION

### *Information Disclosure Statement*

The listing of references in the specification is not a proper information disclosure statement. 37 CFR 1.98(b) requires a list of all patents, publications, or other information submitted for consideration by the Office, and MPEP § 609.04(a) states, "the list may not be incorporated into the specification but must be submitted in a separate paper." Therefore, unless the references have been cited by the examiner on form PTO-892, they have not been considered.

### *Specification*

The abstract of the disclosure is objected to because it exceeds the 150 word limit. Correction is required. See MPEP § 608.01(b).

The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

1. Claims 1-18 rejected under 35 U.S.C. 102(b) as being anticipated by Hitchins et al.

Art Unit: 3767

Claims 1, 2, 5, 6, 10, 13, 14, 15, and 17: Hitchins et al disclose in Figures 1B and 11 an injector (20) comprising a housing (21) and a drive member (22) comprising a retaining member (412) and outwardly extending flange members (414 and 416); a syringe (10) comprising a body (50) and a plunger (15) comprising a wall (444) having an inner surface defining a retaining shoulder and inwardly projecting flanges (440); wherein at least one retaining member (412) on the drive member is adapted to engage with the retaining shoulder to enable the drive member to retract the plunger (Figure 2B); and wherein the inwardly projecting flanges (440) are adapted to engage the engaging flange members on the drive member (414 and 416) when the syringe is rotated about its longitudinal axis operable to cause the retaining member to disengage the retaining shoulder (column 14, lines 10-15).

Claims 3, 4, 8, 9, 12, and 16: Hitchins et al disclose in Figure 11 the plurality of flanges (440) spaced evenly, radially, and longitudinally along the wall

Claims 7 and 18: Hitchins et al disclose in Figures 1B and 11 the body (50) and plunger wall (444) being substantially cylindrical.

Claim 11: Hitchins et al disclose in Figure 11 the interior surface of the wall (444) defining a retaining shoulder formed on an axial plane and the plurality of inwardly projecting flanges (440) radially spaced along the interior surface of the wall and extending in a longitudinal direction proximal to the retaining shoulder.
